EX SENSE

desensitizer

Sensitive teeth often occur as a result of dental erosion or exposed dentin.

Cavex ExSense is a high quality desensitizer with 2% hydroxyapatite, an ingredient that helps fill small irregularities in the enamel and soothe sensitive areas using hydrodispensing sol. The formula also contains 0.1% potassium nitrate, which helps to relieve tooth sensitivity.

Application

The desensitizer helps to reduce the feeling of tooth sensitivity. It provides long-lasting care for sensitive teeth, both with sudden stimuli and with persistent discomfort.

The pleasant tasting gel can be applied in two ways: by rubbing in gently with the finger or by wearing it in a tray for about ten minutes. Due to its easy application, Cavex ExSense can be used by practitioners in the practice as well as by patients at home.

Features

- Hydroxyapatite helps to care for the tooth surface and smooth out small irregularities
- Supports the maintenance of a comfortable feeling in sensitive teeth
- Contributes to the remineralization process
- Pleasant mint taste
